1 [Parametric polymorphism in Java: an approach to translation based on reflective features](#)

Mirko Viroli, Antonio Natali

The introduction of parametric polymorphism in Java with translation approaches has been shown to be of considerable interest, allowing the definition of extensions of Java on top of the existing Virtual Machines. Homogeneous translations furthermore, seem to be more useful than heterogeneous, avoiding the continuous increase of library code with redundant information. At this time however, homogeneous approaches aren't as flexible as heterogeneous, with extensions failing to integrate well with ...

To date, systems offering multitasking for the Java[®] programming language either use one process or one class loader for each application. Both approaches are unsatisfactory. Using operating system processes is expensive, scales poorly and does not fully exploit the protection features inherent in a safe language. Class loaders replicate application code, obscure the type system, and non-uniformly treat 'trusted' and 'untrusted' classes, which leads to subtle, but nevertheless, potenti ...

Reducing application size is important for software that is distributed via the internet, in order to keep download times manageable, and in the domain of embedded systems, where
